Test Plan – Aurazone Website

1. Objective

The objective of this testing is to evaluate the functionality, usability, and performance of the website https://test.aurazone.shop/ and identify defects.

2. Scope

The following areas will be tested:

- Website UI and layout
- Navigation and links
- Product listing and details
- Add to cart functionality
- Forms (login/signup if available)
- Responsiveness (mobile view)

Testing will focus on core user flows and critical functionalities.

3. Features to be Tested

- Homepage loading
- Navigation menu
- Product search and filtering
- Product detail page
- Add to cart / remove from cart
- Checkout flow (if available)
- Form validations

4. Types of Testing

- Functional Testing
- UI Testing
- Exploratory Testing
- Usability Testing
- Cross-browser Testing

5. Assumptions

- This is a test/staging website
- Payment functionality may not be fully functional
- Test data is not real

6. Test Approach

Testing will be performed using exploratory and scenario-based approaches to simulate real user behavior. Basic automation will be performed for key flows using tools like Playwright or Selenium.

7. Entry Criteria

- Website is accessible
- No login restrictions for basic usage

8. Exit Criteria

- At least 5 bugs identified and documented
- Core functionalities tested
- Cross-browser testing completed

9. Tools Used

- Browser: Chrome, Edge
- Developer Tools (for mobile testing)
- Snipping Tool (for screenshots)
- Playwright/Selenium (for automation)

Cross-Platform Testing

Objective :

To verify that the Aurazone website functions correctly and maintains consistent UI/UX across different browsers and devices.

Desktop Testing :

Browsers Tested

- Google Chrome (latest version)
- Microsoft Edge (latest version)

Test Scenarios

- Homepage loading
- Navigation between pages
- Product listing and detail view
- Add to cart functionality
- Button clicks and interactions

Observations

- Website loads successfully in both Chrome and Edge
- Navigation works as expected across pages
- No major functional issues observed
- Minor UI inconsistencies noticed (spacing/alignment differences)
- Font rendering may slightly vary between browsers

Mobile Testing :

Devices Tested

- iPhone (via Chrome DevTools – iPhone 12 view)
- Android (via Chrome DevTools – Pixel view)

Test Scenarios

- Homepage responsiveness
- Product page layout
- Image scaling
- Button visibility and usability
- Scrolling behavior

Observations

- Layout is partially responsive but not fully optimized
- Some UI elements appear misaligned on smaller screens
- Buttons may appear compressed or too close together
- Product images do not scale properly in some views
- Text overlap observed in certain sections
- Scrolling experience is slightly inconsistent

Conclusion

The website works across major desktop browsers with minimal issues. However, mobile responsiveness needs improvement to ensure a consistent and user-friendly experience across all devices.

QA Thinking

High-Risk Areas

Based on testing and analysis, the following areas are identified as high-risk:

1. Cart and Checkout Functionality

This is the most critical part of the application. Any issue in adding products, updating cart items, or proceeding to checkout can directly impact user purchases and business revenue.

2. Product Data Consistency

Product images, sizes, and descriptions must match accurately. Inconsistencies (like different product images for the same item or incorrect size labels) can confuse users and reduce trust.

3. Form Validation and User Input

Improper validation in login/signup or checkout forms may lead to invalid data submission, poor user experience, and potential security concerns.

4. Mobile Responsiveness

A large number of users access e-commerce platforms via mobile devices. UI issues such as misalignment, overlapping elements, or poor scaling can significantly affect usability.

5. Navigation and User Flow

Smooth navigation between pages (homepage → product → cart) is essential. Broken links or unclear navigation paths can lead to user drop-off.

Prioritization (If Given More Time)

If more time were available, testing would be prioritized in the following order:

1. End-to-end checkout flow (critical business functionality)

2. Cart operations and data persistence
3. Product data accuracy and consistency
4. Mobile usability and responsiveness
5. Edge cases and negative scenarios (invalid inputs, error handling)

Recommendations

1. Improve Data Consistency

Ensure that product images, sizes, and descriptions are correctly mapped. All images in a product gallery should represent the same product.

2. Enhance Mobile Responsiveness

Optimize layout and UI elements for smaller screens. Fix alignment issues, improve button spacing, and ensure proper scaling of images and text.

3. Implement Strong Form Validation

Add proper validation messages for empty or incorrect inputs. This will improve user experience and prevent invalid data submission.

4. Improve User Feedback Mechanisms

Provide clear feedback for user actions (e.g., confirmation when adding items to cart, error messages when actions fail).

5. Optimize Performance

Improve page load speed and responsiveness, especially for product pages and images, to enhance overall user experience.
